Netbeans Platform
For Rich Client Development

Rich Client Platform

Lukáš Bartoň
Hewlett-Packard

Jaroslav Tulach
Sun Microsystems
The Need for NetBeans and/or Eclipse

Don't write yet another framework, please!

Rest in piece to home made frameworks!
The Need for Modular Applications

- Applications get more complex
- Assembled from pieces
- Developed by distributed teams
- Components have complex dependencies
- Good architecture
  - Know your dependencies
  - Manage your dependencies
The Need for Rich Desktop Clients

- Web will not do it all
  - Real time interaction (dealing, monitoring)
  - Integration with OS (sound, etc.)
- 100% Java counts
  - Ease of administration and distribution
  - Plain Swing maybe too plain
- NetBeans Platform
  - The engine behind NetBeans IDE
Building Platforms (1/2)

- It all starts with components
  - applications are composed of components that plug into the platform
- When starting development on Application, it is common to provide a handful of domain-specific components that sit directly on top of RCP
Building Platforms (2/2)

- It’s natural for RCP development to spawn one or more “platforms”
  - A custom base for multiple development teams to build their applications upon
What is Eclipse?

- Eclipse is a Java IDE
- Eclipse is an IDE Framework
- Eclipse is a Tools Framework
- Eclipse is an Application Framework
- Eclipse is an Open Source Project
- Eclipse is an Open Source Community
- Eclipse is an Eco-System
- Eclipse is a Foundation
What is NetBeans?

- NetBeans is a Java IDE
- NetBeans is an IDE Framework
- NetBeans is a Tools Framework
- NetBeans is an Application Framework
- NetBeans is an Open Source Project
- NetBeans is an Open Source Community
- NetBeans is an Eco-System
- NetBeans is Sun sponsored Open Source Project
Eclipse Rich Client Platform

- SWT - The Standard Widget Toolkit
  - Access to the user-interface facilities of the operating systems on which it is implemented
- JFace
  - UI toolkit with classes for handling many common UI programming tasks that works with SWT
- UI
  - Base classes for UI components
- Equinox
  - Implementation of OSGI plug-in architecture
- Runtime
- Update
NetBeans Platform
for Rich Client Development

- 100% Java
  - no necessary 3\textsuperscript{rd} party libraries
- Swing
  - the most standard Java toolkit
- Window System
  - docking framework extensions around Swing
- Module System
- Runtime
- Auto Update
Equinox (1/2)

- Equinox is the Eclipse component model
  - Based on OSGi R4 specification
  - Standard Java lacks an explicit notion of components
- Components == Bundles == Plug-in
  - Versioned
  - Defined declaratively
  - Dynamically loadable/unloadable
  - Support dynamic update and install
- Explicitly define
  - Dependencies
  - Runtime visibility
  - Interactions (extension points/extensions)
Components integrate without interfering
  - Required components explicitly set
  - Unrelated components do not have direct access to one-another

Downstream components can access upstream components through the extension mechanism
  - Downstream component registers (declaratively) an extension point
  - Dependent components register (declaratively) extensions

Plug-in may be automatically stared at platform startup

All required plug-ins are loaded automatically

Plug-in may have activator class
Modularity in NetBeans

Modify your application to be NetBeans module

▪ Module is any JAR file with enhanced manifest

Manifest-Version: 1.0
OpenIDE-Module: org.netbeans.modules.text/1
OpenIDE-Module-Specification-Version: 1.13

▪ What is this good for?
  ▪ Identification of each library
  ▪ Version specification
  ▪ Dependencies
Modularity in NetBeans

Dependencies between modules

- OpenIDE-Module-Specification-Version: 1.13
  OpenIDE-Module-Provides: EditorImpl
  OpenIDE-Module-Module-Dependencies:
    org.netbeans.api.spellchecker/1 > 1.3,
    org.netbeans.core > 4.32
  OpenIDE-Module-Requires: SpellImpl

- Types of modules
  - Regular
  - Autoload
  - Eager
Modularity in NetBeans

Module Enablement and ClassLoader Hierarchy

- Dependencies influence runtime classpath
- A module can turn other modules on

```
org.netbeans.modules.text/1
  Provides: EditorImpl
  Requires: SpellImpl

org.netbeans.api.spellchecker/1

org.netbeans.core

org.netbeans.spellimpl
  Provides: SpellImpl
  Autoload
```
Eclipse Workbench (1/2)

- Fundamental component – appear as a collection of windows
- Provides contribution-based UI extensibility
- Defines a powerful UI paradigm with windows, perspectives, views, editors, and actions
- Allows you (developer) and user to work with those UI components

- You implement advisors which participate in:
  - Workbench startup and shutdown
  - Showing menu, toolbar, status line, configuring shown components
  - Programmatically define actions shown
Eclipse Workbench (2/2)
Views and Editors

- **View Parts**

- **Views**
  - There is usually one instance of a view
  - Views can appear all around Editor Area
  - Views can have local menus and toolbars
  - User can hide/show views from menu

- **Editors**
  - There could be several instances of the same type of editor
  - Editors can appear in only one region of the page
  - Editors can be in a dirty state
  - Editors don’t have local menus and toolbars
  - User can open editor only by editing (creating new) resource
    - To open Editor you have to create EditorInput
Perspectives

- Group together and organize UI elements that relate to specific task
- Defines placement and size of views and editors
  - Stored in user's workspace
- Use can activate perspective from menu
Actions, Progress, Preferences

- Actions can be defined declaratively or programmatically
  - You can place action to menu from another plug-in
  - Action can react on selection change (even declaratively)
  - You can define shortcuts for actions
- Infrastructure for running background task
  - User can observe progress
  - User can stop task
- Preferences
  - You can define editable preferences (Preference Pages)
  - You can store UI parts' (plug-ins') properties into workspace programmatically (there is special folder for each plug-in)
Cooperation of plug-ins (1/3)

<requires>
  <import plugin="org.eclipse.core.runtime"/>
  <import plugin="org.eclipse.core.resources"/>
  <import plugin="org.eclipse.ui"/>
  <import plugin="org.eclipse.ui.ide"/>
  <import plugin="org.eclipse.jface.text"/>
  <import plugin="org.eclipse.ui"/>
  <import plugin="org.eclipse.ui.ide"/>
  <import plugin="org.eclipse.ui.views"/>
  <import plugin="org.eclipse.ui.workbench.texteditor"/>
  <import plugin="org.eclipse.ui.editors"/>
  <import plugin="org.eclipse.jdt.core"/>
  <import plugin="org.eclipse.jdt.ui"/>
  <import plugin="org.springframework.ide.eclipse.core"/>
</requires>
Cooperation of plug-ins (2/3)

<extension
  point="org.eclipse.ui.popupMenus">
  <objectContribution adaptable="true"
    objectClass="org.eclipse.core.resources.IProject"
    id="org.springframework.ide.eclipse.ui.actions.nonSpringProject">
    <visibility>
      <and>
        <not>
          <objectState name="nature"
            value="org.springframework.ide.eclipse.core.springnature" />
        </not>
        <not>
          <objectState name="nature"
            value="org.springframework.ide.eclipse.beans.core.beansnature" />
        </not>
      </and>
    </visibility>
    <action label="%popupMenus.addNature.label"
      class="org.springframework.ide.eclipse.ui.internal.actions.AddRemoveNature"
      enablesFor="+
        id="org.springframework.ide.eclipse.ui.actions.addNature">
    </action>
  </objectContribution>
Cooperation of plug-ins (3/3)
Connecting View Parts Together (1/2)

- Using the selection
  - Provider extends ISelectionInterface (Structured selection, Text selection), when provider is JFace UI component you are done
  - Listener must understand to emitted events, ignore unknown events
Connecting View Parts Together (2/2)

- Part Listeners
  - Listen on event specific to View Parts – close, open, hide, ...
- Direct communication
  - Callback methods
  - Register listener via extension point
Sample Application: V-Builder
Cooperation of Modules

Composition of UI Elements

- Menu, toolbar elements
  - Get merged together by the NetBeans framework
- Windows Layout
- Registration solved by Layers

```xml
<folder name="Menu">
  <folder name="File">
    <file name="Open.instance">
      <attr instanceCreate="org.openide.actions.OpenAction" />
    </file>
  </folder>
</folder>
```
Cooperation of Modules

Composition of Menu

```
<folder name="Menu/File">
  <file name="NewProject.instance" />
  <file name="ImportProject.instance" />
  <file name="Separator.instance" />
  <file name="OpenProject.instance" />
  <file name="OpenRecent.instance" />
  <file name="CloseProject.instance" />
</folder>

<folder name="Menu/File">
  <file name="NewFile.instance" />
  <file name="Open.instance" />
</folder>

<folder name="Menu/File">
  <attr name="NewProject.instance/NewFile.instance" boolvalue="true" />
  <attr name="NewFile.instance/ImportProject.instance" boolvalue="true" />
  <attr name="OpenProject.instance/Open.instance" />
  <attr name="Open.instance/OpenRecent.instance" />
</folder>
```
Cooperation of Modules

Exposing module state

- A module owns a Window, another an action
- Windows can have associated Context
- Selected window defines the global context
- UI Elements update its state according to it
- What is inside context?
  - Anything important (javax.swing.Document, etc.)
- What operations context need to support?
  - Changes of its content
  - Observability
Cooperation of Modules

Exposing Window State

class MyWindow
extends org.openide.windows.TopComponent {
    private JEditorPane pane;

    public org.openide.util.Lookup getLookup () {
        return Lookups.singleton(pane.getDocument());
    }
}

package com.acme.sp;

import java.lang.*;

/**
 * This application does nothing, but should compile cleanly
 * and demonstrate how to use JDiff to track changes in API between
 * versions of products.
 */

public class Main {

    /**
     * The main program for SuperPro...
     */
import org.openide.util.Utilities;

class MyInsertAction extends AbstractAction {
    public void actionPerformed (ActionEvent ev) {
        Lookup lkp = Utilities.actionGlobalContext();
        Document doc = lkp.lookup (Document.class);
        if (doc != null) {
            doc.insertString ("Hello world!", null, 0);
        }
    }
}

In similar way one can listen to changes in Lookup using LookupListener.
class Node extends FeatureDescriptor {
    public Children getChildren();
    public Lookup getLookup();
    public void addNodeListener(NodeListener);
    public void removeNodeListener(NodeListener);
}
class Children {
    public Node[] getNodes();
}

What actions are used by you and others?
This statistic allows you to see the actions that you and others were using during the work. The actions names are the actual names of the classes in the application and each of them is associated with number of its invocations. This page usually displays a "top ten" of the most used actions, however it also offers a way to customize the list of actions by use of regular expressions. See bottom of this page for details.
Command Line API and Server Side NetBeans

Demo
Sample Eclipse RCP Application

Demo
Branding

- You can define:
  - Launcher name and icon for each operating system
  - Window icons
  - Splash screen
  - Progress bar placement
  - About dialog
Deployment Scenarios

- What is stored on file system
  - Install location
  - Configuration location
  - Workspace
- Independent installs
- Shared Installs
  - Read only install
  - Configuration is stored in user home directory
- Shared Configurations
  - Configuration precreated on server
- Multiple Configurations
  - Sharing common plugins
Each product consists of a sets of clusters
Has its own launcher
`nbexec -cluster platform:ide:netbeans`
Can provide branding of shared resources
Future

- Embedded RCP
- JFace
  - Databinding in Eclipse 3.3
  - Nebula project
- Many interesting Eclipse project – i.e you can reuse plugins
  - Business Intelligence and Reporting Tools
  - Eclipse Communication Framework
  - Eclipse Process Framework, Eclipse Java Workflow Tooling
  - Maya - installations
  - Open Healthcare Framework
Future of Swing and NetBeans

- JSR 277
  - Java Module System
- JSR 295
  - Beans Binding
- JSR 296
  - Swing Application Framework
- JSR 269
  - Retouche
- Linux Packaging
  - ubuntu, rpm
Convert Swing Application to NetBeans
